Task 1

Student Grade Calculator - Labs 1 & 2 Focus

Topics Covered: Lab 1 (Variables, Data Types, Arrays, Type Conversion) & Lab 2 (Methods, Control Structures, Strings)

Scenario:
Create a simple student grade calculator that manages student grades using basic Java concepts.

Requirements:
- Create a `StudentGradeCalculator` class with the following:

Attributes:
- `studentNames` (String array of size 10)
- `studentGrades` (double array of size 10) - stores average grade
- `subjectNames` (String array) - subject names
- `grades` (2D array: [studentIndex][subjectIndex]) - stores grades per subject

Constructors:
- Parameterized constructor (subjectNames array)

Required Methods:

Lab 1 Topics - Variables & Arrays:
- `addStudent(String name)` - Adds student name to array
- `addGrade(int studentIndex, int subjectIndex, double grade)` - Adds grade to 2D array
- `getAllGrades(int studentIndex)` - Returns array of all grades for a student
- `calculateAverage(int studentIndex)` - Returns average grade (double)

Lab 1 Topics - Type Conversion:
- `convertToPercentage(double grade)` - Converts grade (0-4.0) to percentage (0-100)
- `getGradeAsString(int studentIndex)` - Returns grade as String

Lab 2 Topics - Methods & Control Structures:
- `getLetterGrade(int studentIndex)` - Returns 'A', 'B', 'C', 'D', or 'F' using switch statement
- `isPassing(int studentIndex)` - Returns true if average >= 60 (use ternary operator)
- `getGradeStatus(int studentIndex)` - Returns "Excellent", "Good", "Average", or "Fail" using if/else

Lab 2 Topics - String Operations:
- `getStudentInitials(int studentIndex)` - Returns initials (e.g., "John Doe" → "JD")
- `searchStudent(String searchName)` - Returns student index or -1 (case-insensitive search)
- `formatStudentInfo(int studentIndex)` - Returns formatted String: "Name: X, Grade: Y"

Lab 2 Topics - Array Operations in Methods:
- `findTopStudent()` - Returns index of student with highest average
- `getPassingStudents()` - Returns array of passing student indices
- `calculateClassAverage()` - Returns average of all students

Test Scenario:
```
// In Main class:
// 1. Create calculator with subjects: "Math", "Science", "English"
// 2. Add 3 students
// 3. Add grades for each student
// 4. Calculate averages and display results
```

Solution

```
class StudentGradeCalculator {
    private String[] studentNames = new String[10];
    private double[] studentGrades = new double[10];
    private String[] subjectNames;
    private double[][] grades = new double[10][10];
    private int studentCount = 0;

    public StudentGradeCalculator(String[] subjectNames) {
        this.subjectNames = subjectNames;
    }

    // Lab 1: Variables & Arrays
    public void addStudent(String name) {
        if (studentCount < 10) {
            studentNames[studentCount] = name;
            studentCount++;
        }
    }

    public void addGrade(int studentIndex, int subjectIndex, double grade) {
        if (studentIndex < studentCount && subjectIndex < subjectNames.length) {
            grades[studentIndex][subjectIndex] = grade;
        }
    }

    public double[] getAllGrades(int studentIndex) {
        double[] studentAllGrades = new double[subjectNames.length];
        for (int i = 0; i < subjectNames.length; i++) {
            studentAllGrades[i] = grades[studentIndex][i];
        }
        return studentAllGrades;
    }

    public double calculateAverage(int studentIndex) {
        double sum = 0;
        for (int i = 0; i < subjectNames.length; i++) {
            sum += grades[studentIndex][i];
        }
        double avg = sum / subjectNames.length;
        studentGrades[studentIndex] = avg; // Store average
        return avg;
    }

    // Lab 1: Type Conversion
    public double convertToPercentage(double grade) {
        return (grade / 4.0) * 100.0;
    }

    public String getGradeAsString(int studentIndex) {
        return String.valueOf(studentGrades[studentIndex]);
    }

    // Lab 2: Methods & Control Structures
    public char getLetterGrade(int studentIndex) {
```

```java
    int avg = (int) studentGrades[studentIndex] / 10;
    switch (avg) {
        case 10:
        case 9: return 'A';
        case 8: return 'B';
        case 7: return 'C';
        case 6: return 'D';
        default: return 'F';
    }
}

public boolean isPassing(int studentIndex) {
    return (studentGrades[studentIndex] >= 60) ? true : false;
}

public String getGradeStatus(int studentIndex) {
    double avg = studentGrades[studentIndex];
    if (avg >= 90) return "Excellent";
    else if (avg >= 70) return "Good";
    else if (avg >= 60) return "Average";
    else return "Fail";
}

// Lab 2: String Operations
public String getStudentInitials(int studentIndex) {
    String name = studentNames[studentIndex];
    int spaceIndex = name.indexOf(' ');
    if (spaceIndex != -1) {
        String first = String.valueOf(name.charAt(0));
        String last = String.valueOf(name.charAt(spaceIndex + 1));
        return first + last;
    }
    return String.valueOf(name.charAt(0));
}

public int searchStudent(String searchName) {
    for (int i = 0; i < studentCount; i++) {
        if (studentNames[i].toLowerCase().equals(searchName.toLowerCase())) {
            return i;
        }
    }
    return -1;
}

public String formatStudentInfo(int studentIndex) {
    return String.format("Name: %s, Grade: %.2f", studentNames[studentIndex], studentGrades[studentIndex]);
}

// Lab 2: Array Operations in Methods
public int findTopStudent() {
    double highest = studentGrades[0];
    int topIndex = 0;
    for (int i = 1; i < studentCount; i++) {
        if (studentGrades[i] > highest) {
            highest = studentGrades[i];
            topIndex = i;
```

```
        }
    }
    return topIndex;
  }

  public int[] getPassingStudents() {
    int count = 0;
    for (int i = 0; i < studentCount; i++) {
      if (isPassing(i)) count++;
    }
    int[] passingIndices = new int[count];
    int index = 0;
    for (int i = 0; i < studentCount; i++) {
      if (isPassing(i)) {
        passingIndices[index] = i;
        index++;
      }
    }
    return passingIndices;
  }

  public double calculateClassAverage() {
    double sum = 0;
    for (int i = 0; i < studentCount; i++) {
      sum += studentGrades[i];
    }
    return (studentCount == 0) ? 0 : (sum / studentCount);
  }
}
class Main {
  public static void main(String[] args) {
    String[] subjects = {"Math", "Science", "English"};
    StudentGradeCalculator calc = new StudentGradeCalculator(subjects);

    calc.addStudent("Kamran Gul");
    calc.addGrade(0, 0, 85);
    calc.addGrade(0, 1, 90);
    calc.addGrade(0, 2, 88);

    calc.addStudent("Ali Hassan");
    calc.addGrade(1, 0, 55);
    calc.addGrade(1, 1, 60);
    calc.addGrade(1, 2, 58);

    calc.calculateAverage(0);
    calc.calculateAverage(1);

    System.out.println(calc.formatStudentInfo(0));
    System.out.println("Initials: " + calc.getStudentInitials(0));
    System.out.println("Letter Grade: " + calc.getLetterGrade(0));
    System.out.println("Status: " + calc.getGradeStatus(0));
    System.out.println("Is Passing: " + calc.isPassing(0));

    System.out.println("\nTop Student Index: " + calc.findTopStudent());
    System.out.println("Class Average: " + calc.calculateClassAverage());
  }}
```

Output

```
Name: Kamran Gul, Grade: 87.67
Initials: KG
Letter Grade: B
Status: Good
Is Passing: true

Top Student Index: 0
Class Average: 72.66666666666667
```

Task 2

Product Inventory System - Labs 3 & 4 Focus
Topics Covered: Lab 3 (Objects, Classes, Encapsulation, Constructors, Getters/Setters) & Lab 4 (Method Overloading, 2D Arrays, Enhanced For Loops)

Scenario:
Create a product inventory system using object-oriented programming concepts with encapsulation and method overloading.

Requirements:
- Create a `ProductInventory` class with the following:

Private Attributes (Lab 3 - Encapsulation):
- `productNames` (String array of size 15)
- `productPrices` (double array of size 15)
- `productStock` (int array of size 15)
- `productCategories` (String array of size 15)
- `inventoryName` (String)

Constructors (Lab 3):
- Default constructor - initializes inventoryName to "Default Inventory"
- Parameterized constructor (inventoryName)

Required Methods:

Lab 3 Topics - Getters and Setters:
- `setInventoryName(String name)` - Setter with validation (length >= 3)
- `getInventoryName()` - Getter
- `setProductPrice(int productIndex, double price)` - Setter with validation (price > 0)
- `getProductPrice(int productIndex)` - Getter

Lab 3 Topics - Object Operations:
- `addProduct(String name, double price, String category, int stock)` - Adds product to arrays
- `updateProduct(int productIndex, String name, double price, int stock)` - Updates product info
- `removeProduct(int productIndex)` - Removes product (sets to null/0)

Lab 4 Topics - Method Overloading:
- `addStock(int productIndex, int quantity)` - Adds stock (single product)
- `addStock(int[] productIndices, int[] quantities)` - Overloaded: adds stock to multiple products
- `applyDiscount(int productIndex, double percentage)` - Applies discount to single product

- `applyDiscount(String category, double percentage)` - Overloaded: applies discount to all products in category

Lab 4 Topics - 2D Arrays:
- `getInventoryTable()` - Returns 2D array [productIndex][name, price, stock]
- `getCategoryTable()` - Returns 2D array [category][total products, total value]
- `updateMonthlyStock(int[][] stockData)` - Updates stock from 2D array [product][month]

Lab 4 Topics - Enhanced For Loops:
- `getAllProductNames()` - Returns array using enhanced for loop
- `calculateTotalValue()` - Calculates total inventory value using enhanced for loop
- `findLowStockProducts(int threshold)` - Returns array of low stock products using enhanced for loop

Lab 4 Topics - Break and Continue:
- `findFirstExpensiveProduct(double minPrice)` - Uses break when first product found
- `countValidProducts()` - Uses continue to skip invalid products (price <= 0)

Test Scenario:
```
// In Main class:
// 1. Create ProductInventory
// 2. Add 4-5 products
// 3. Test getters and setters
// 4. Test method overloading
// 5. Test 2D array operations
```

Solution

```java
class ProductInventory {
    // Lab 3: Encapsulation (Private Attributes)
    private String[] productNames = new String[15];
    private double[] productPrices = new double[15];
    private int[] productStock = new int[15];
    private String[] productCategories = new String[15];
    private String inventoryName;
    private int productCount = 0;

    // Lab 3: Constructors
    public ProductInventory() {
        this.inventoryName = "Default Inventory";
    }

    public ProductInventory(String inventoryName) {
        this.inventoryName = inventoryName;
    }

    // Lab 3: Getters and Setters
    public void setInventoryName(String name) {
        if (name.length() >= 3) {
            this.inventoryName = name;
        } else {
            System.out.println("Invalid name length.");
        }
    }

    public String getInventoryName() {
        return this.inventoryName;
    }

    public void setProductPrice(int productIndex, double price) {
        if (price > 0 && productIndex < productCount) {
            this.productPrices[productIndex] = price;
```

```
    }
}

public double getProductPrice(int productIndex) {
    return this.productPrices[productIndex];
}

// Lab 3: Object Operations
public void addProduct(String name, double price, String category, int stock) {
    if (productCount < 15) {
        this.productNames[productCount] = name;
        this.productPrices[productCount] = price;
        this.productCategories[productCount] = category;
        this.productStock[productCount] = stock;
        productCount++;
    }
}

public void updateProduct(int productIndex, String name, double price, int stock) {
    if (productIndex < productCount) {
        this.productNames[productIndex] = name;
        this.productPrices[productIndex] = price;
        this.productStock[productIndex] = stock;
    }
}

public void removeProduct(int productIndex) {
    if (productIndex < productCount) {
        this.productNames[productIndex] = null;
        this.productPrices[productIndex] = 0.0;
        this.productStock[productIndex] = 0;
        this.productCategories[productIndex] = null;
    }
}

// Lab 4: Method Overloading
public void addStock(int productIndex, int quantity) {
    if (productIndex < productCount) {
        this.productStock[productIndex] += quantity;
    }
}

public void addStock(int[] productIndices, int[] quantities) {
    for (int i = 0; i < productIndices.length; i++) {
        addStock(productIndices[i], quantities[i]);
    }
}

public void applyDiscount(int productIndex, double percentage) {
    if (productIndex < productCount) {
        double discount = this.productPrices[productIndex] * (percentage / 100.0);
        this.productPrices[productIndex] -= discount;
    }
}

public void applyDiscount(String category, double percentage) {
```

```java
    for (int i = 0; i < productCount; i++) {
        if (this.productCategories[i] != null && this.productCategories[i].equals(category)) {
            applyDiscount(i, percentage);
        }
    }
}

// Lab 4: 2D Arrays (Type casting into String for mixed data types)
public String[][] getInventoryTable() {
    String[][] table = new String[productCount][3];
    for (int i = 0; i < productCount; i++) {

}
```

```java
class Main {
  public static void main(String[] args) {
    ProductInventory inv = new ProductInventory("Tech Store");

    inv.addProduct("Laptop", 1200.50, "Electronics", 10);
    inv.addProduct("Mouse", 25.00, "Accessories", 50);
    inv.addProduct("Keyboard", 45.00, "Accessories", 30);

    inv.setProductPrice(1, 20.00);
    System.out.println("Inventory Name: " + inv.getInventoryName());

    inv.addStock(1, 10);
    inv.applyDiscount("Accessories", 10.0);

    System.out.println("\nInventory Table:");
    String[][] table = inv.getInventoryTable();
    for (int i = 0; i < table.length; i++) {
      if (table[i][0] != null) {
        System.out.printf("Name: %s | Price: %s | Stock: %s\n", table[i][0], table[i][1], table[i][2]);
      }
    }

    System.out.println("\nTotal Value: " + inv.calculateTotalValue());
    System.out.println("Valid Products Count: " + inv.countValidProducts());
  }
}
```

Output

```
Inventory Name: Tech Store

Inventory Table:
Name: Laptop | Price: 1200.5 | Stock: 10
Name: Mouse | Price: 18.0 | Stock: 60
Name: Keyboard | Price: 40.5 | Stock: 30

Total Value: 14300.0
Valid Products Count: 3
```

Task 3

Library Management System - Labs 5 & 6 Focus

Topics Covered: Lab 5 (Static Members, Final Keyword, Varargs, Access Modifiers) & Lab 6 (Circular Buffers, Problem-Solving, Advanced Arrays)

Scenario:
Create a library management system using advanced OOP features like static members, varargs, and circular buffers.

Requirements:
- Create a `LibrarySystem` class with the following:

Private Attributes:
- `libraryName` (String)
- `bookTitles` (String array of size 15)
- `bookIds` (String array of size 15)
- `isAvailable` (boolean array of size 15)
- `borrowerNames` (String array of size 15)
- `transactionHistory` (String array of size 10) - circular buffer (Lab 6)
- `bookCount` (int) - static variable (Lab 5)
- `MAX_BOOKS` (int) - final static variable = 15 (Lab 5)

Constructors:
- Parameterized constructor (libraryName)

Required Methods:

Lab 5 Topics - Static Members:
- `addBook(String title, String bookId)` - Adds book, increments static bookCount
- `getBookCount()` - Static method returning total books
- `getLibraryStatistics()` - Returns String with statistics using static variable

Lab 5 Topics - Final Keyword:
- `validateBookLimit()` - Returns true if bookCount < MAX_BOOKS (uses final variable)
- `getMaxCapacity()` - Returns MAX_BOOKS value

Lab 5 Topics - Varargs:
- `addMultipleBooks(String... bookTitles)` - Adds multiple books using varargs
- `borrowBooks(int... bookIndices)` - Borrows multiple books using varargs
- `returnBooks(int... bookIndices)` - Returns multiple books using varargs

Lab 5 Topics - Access Modifiers:
- `validateBookId(String id)` - Private method (validates ID format)
- `getInternalBookInfo(int bookIndex)` - Protected method (returns internal book data)
- `setLibraryName(String name)` - Public setter with validation

Lab 6 Topics - Circular Buffer:
- `recordTransaction(String transaction)` - Records transaction in circular buffer
- `getTransactionHistory()` - Returns array of recent transactions (last 10)
- `getRecentTransactions(int count)` - Returns last N transactions

Lab 6 Topics - Problem-Solving Methods:
- `borrowBook(int bookIndex, String borrowerName)` - Borrows book, records transaction
- `returnBook(int bookIndex)` - Returns book, records transaction
- `findAvailableBooks()` - Returns array of available book indices
- `findBorrowedBooks()` - Returns array of borrowed book indices
- `searchBooks(String searchTerm)` - Returns array of matching book indices

Lab 6 Topics - Advanced Array Operations:

- `getAllBookTitles()` - Returns array of all book titles
- `getBorrowerStatistics()` - Returns 2D array [borrower][book count, book titles]
- `calculateBorrowRate()` - Returns percentage of books borrowed

Integration Method:

- `generateLibraryReport()` - Returns comprehensive String report using all methods

Test Scenario:

```
// In Main class:
// 1. Create LibrarySystem
// 2. Add books (using varargs)
// 3. Borrow and return books
// 4. Test static methods
// 5. View transaction history
// 6. Generate report
```

Solution

```
class LibrarySystem {
    // Private Attributes
    private String libraryName;
    private String[] bookTitles = new String[15];
    private String[] bookIds = new String[15];
    private boolean[] isAvailable = new boolean[15];
    private String[] borrowerNames = new String[15];

    // Circular Buffer variables
    private String[] transactionHistory = new String[10];
    private int transactionCount = 0;

    // Lab 5: Static and Final
    private static int bookCount = 0;
    private static final int MAX_BOOKS = 15;

    // Constructors
    public LibrarySystem(String libraryName) {
        this.libraryName = libraryName;
    }

    // Lab 5: Static Members
    public void addBook(String title, String bookId) {
        if (bookCount < MAX_BOOKS) {
            bookTitles[bookCount] = title;
            bookIds[bookCount] = bookId;
            isAvailable[bookCount] = true;
            borrowerNames[bookCount] = "None";
            bookCount++;
        }
    }

    public static int getBookCount() {
        return bookCount;
    }

    public static String getLibraryStatistics() {
        return "Total Books in System: " + bookCount;
    }
```

```java
// Lab 5: Final Keyword
public boolean validateBookLimit() {
